BROWN BAG SEMINAR

China: Research and Education Opportunities

In the fall of 2005, three researchers from the University of Kansas traveled to China to explore research opportunities with several Chinese universities. We explored the science education opportunities with the universities and with several secondary schools. We explored issues related to atmospheric conditions, bioindicators and biodiversity as measures of environmental health as potential areas of research. This brown bag will present our findings and possible future directions for scientific and educational collaborations.
